Intervention Strategy Description

Implementation of a city excise tax of $0.0175/ounce of sugar-sweetened beverages (SSBs), administered by the city department of revenue and based on proposals considered by federal, state, and local governments.1-4

Background

SSBs include all beverages with added caloric sweeteners. The modeled excise tax does not apply to 100% juice, milk products, or artificially-sweetened beverages. Although SSB consumption has declined in recent years, children and adults in the U.S. consume twice as many calories from SSBs compared to 30 years ago.5-7 Randomized trials and longitudinal studies have linked SSB consumption to excess weight gain, diabetes, and cardiovascular disease. Consumption of SSBs increases the risk of chronic diseases through its impact on BMI and other mechanisms.8,9 The Dietary Guidelines for Americans, 201510 recommends that individuals reduce SSB intake in order to manage their body weight. Drawing on the success of tobacco taxation and decades of economic research, public health experts have called for higher taxes on SSBs and documented their likely impact.11-14 In 2009, the IOM recommended that local governments implement tax strategies to reduce consumption of “calorie-dense, nutrient-poor foods,” emphasizing SSBs as an apt target for taxation.15

Modeling Framework

Increased city excise tax linked to change in BMI through change in SSB price and consumption.

Impact of Tax on Price to Consumers

We assume 100% pass through of the tax over the ten years. Empirical studies in Mexico and France indicate that approximately the full amount of the excise tax is passed on to consumers.16 Short term studies for the local tax in Berkeley indicate less than complete pass-through.3,17,18 The expected percent increase in SSB price was estimated based on the average $0.059/ounce reported in a review of beverage demand elasticity (inflated to $0.0612 in 2014 dollars).19 The price per ounce in this study was based on a weighted average across stores, restaurants and other sources proportional to the source of consumed SSBs in NHANES 2009-2010. The price per ounce of SSBs purchased in stores was calculated using weighted averages of two-liter bottles, 12-can cases, and single-serve bottles or cans based on the distribution of package sizes estimated from 2010 Nielsen Homescan data. The $0.0175/ounce excise tax would result in a 21.5% price increase. We assumed that the tax rate would be adjusted annually for inflation to maintain the 21.5% price increase throughout the ten-year modeling time frame.

SSB Consumption and Price Elasticity of Demand

We used regionally-adjusted estimates of total SSB consumption in 2015 published in the UCONN Rudd Center Revenue Calculator for Sugar-Sweetened Beverage Taxes to adjust national age, sex, and race/ethnicity-specific consumption data from NHANES 2005-2010 to estimate current SSB consumption levels in Seattle, WA. Powell et al reviewed studies published 2007-2012 and estimated a mean own-price elasticity of demand for SSBs weighted by SSB category consumption shares of -1.21, ranging from -3.87 to -0.69. Recent research concerning the Berkeley tax indicates a 21% reduction in SSB intake among low income populations.

Direct effect of change in SSB consumption on change in BMI

We conducted evidence reviews for impact of change in SSB intake on BMI, taking into account any dietary compensation. Four large longitudinal studies in adults of sufficient duration were identified. The relationship was modeled using a uniform distribution based on the range of the estimates of the effect of a one serving reduction on BMI (from 0.21 to 0.57). Among youth, a double-blind randomized controlled trial conducted over 18 months found that an additional 8 oz serving of SSBs led to a 1 kg greater weight gain.

Reach

The intervention reaches all youth and adults ages 2 years and older in Seattle, WA.

Costs

The policy change will involve start up and ongoing labor costs for municipal tax department administrators. To implement the intervention, the municipal government will need to process tax statements and conduct audits. Businesses will also need to prepare tax statements and participate in audits, which will require labor from private tax accountants. The cost of implementation in this Seattle model assumes the city will administer the tax themselves and the activities and resources will mirror estimates from the state of WA from a previously planned (but not implemented) excise tax on soft drinks. Cost of tax implementation will vary between locations; the city of Berkeley for example has contracted with a third party to administer the tax at 2% of the annual revenue. The cost and benefit estimates do not include expected tax revenue.

CHOICES Microsimulation Model

The CHOICES microsimulation model for Seattle, WA was used to calculate the costs and effectiveness over ten years (2015–25). This is a stochastic, discrete-time, individual-level microsimulation model designed to simulate the experience of the Seattle, WA population from 2015 to 2025. Cases of obesity prevented were calculated at the end of the model in 2025. The model uses data from: US Census, American Community Survey, Behavioral Risk Factor Surveillance System, NHANES, National Survey of Children’s Health, the Medical Expenditure Panel Survey, and multiple national longitudinal studies. We calculated uncertainty intervals using Monte Carlo simulations programmed in Java over one thousand iterations of the model for a population of simulated individuals representing the city population size.

Impact on Diabetes

We estimated the impact of the tax-induced reduction in SSB intake on diabetes incidence for adults ages 18-79 years using a published meta-analysis of the relative risk of developing diabetes due to a one-serving change in SSB consumption as well as local estimates of diabetes. On average, each 8.5 oz serving of SSBs per day increases the risk of diabetes by 18%. In Seattle, WA, we estimated that the proposed SSB excise tax would lead to a 5% reduction in diabetes incidence – an estimated 130 cases of diabetes prevented – over a one-year period once the tax reaches its full effect.
Expected Yearly SSB Tax Revenue
Based on calculations modeled from the Rudd Center Revenue Calculator for Sugar Sweetened Beverage Taxes, we estimate a $0.0175/ounce excise tax in Seattle could raise approximately $24.7 million each year. This revenue estimate only includes sugar sweetened beverages, not diet beverages. Since diet beverages are consumed by adults at roughly half the rate of sugar sweetened beverages, the tax revenue will also be higher due to these consumption patterns.

Equity and Implementation Considerations
Concerns have been raised regarding the impact of the tax on households with low incomes. Because of the elasticity of -1.21, our analyses clearly indicate that households will spend less on SSBs after the tax goes into effect, providing disposable income for other purchases. In addition, we project that greater health benefits will accrue to low-income consumers who on average consume more SSBs than higher income consumers; the same is true for a number of racial and ethnic groups. Disparities in obesity outcomes should thus decrease following implementation of the proposed tax. In addition, revenue raised from an SSB tax can be reinvested in low income communities; for instance, in Berkeley, CA SSB tax revenue has been allocated for spending on school and community programs, several with a focus on low income or minority populations, to promote healthy eating, diabetes and obesity prevention.31,32

There is opposition from the beverage industry, which spends over $4 billion/year nationwide on marketing.33 Public support for such taxes generally increases with earmarking for prevention activities.34 Relatively small beverage excise taxes are currently applied across many states. The proposed tax is likely to be sustainable if implemented based on the history of tobacco excise taxes. There is potential for a shift in social norms of SSB consumption based on evidence from tobacco control tax and regulatory efforts.35

Discussion

The information in this brief is intended to provide educational information on the cost effectiveness of SSB taxes.
We project that the proposed SSB excise tax policy will prevent thousands of cases of childhood and adult obesity, prevent new cases of diabetes, increase healthy life years and save more in future health care costs than it costs to implement. Revenue from the tax can be used for education and health promotion efforts. Implementing the tax could also serve as a powerful social signal to reduce sugar consumption.
