

NEW HAMPSHIRE: Nutrition and Physical Activity Self-Assessment for Child Care (NAP SACC) Intervention

This brief summarizes a CHOICES Learning Collaborative Partnership simulation model in New Hampshire examining a potential strategy to expand child care providers' access to the Nutrition and Physical Activity Self-Assessment for Child Care (Go NAP SACC) by targeting the state's largest providers via contracted training and technical assistance.

The Issue

Over the past three decades, more and more people have developed obesity.¹ Today, nearly nine percent of 2-5 year olds have obesity.² Now labeled as an epidemic, health care costs for treating obesity-related conditions such as heart disease and diabetes were \$147 billion in 2008.³ While multiple strategies are needed to reverse the epidemic, emerging prevention strategies directed at children show great promise.⁴ A large body of evidence shows that healthy eating, physical activity, and less time watching TV helps kids grow up at a healthy weight.

In New Hampshire, 40% of 2-5 year olds attend licensed child care centers; 24% attend a large center or family child care program.⁵ Making NAP SACC more available can encourage and empower programs to voluntarily improve nutrition, physical activity, and screen time standards.

About NAP SACC and Expanding Access for NH Child Care Programs

Go NAP SACC is an evidence-based, trusted intervention that helps child care programs improve practices for nutrition, active play, and screen time and can reduce childhood obesity.^{6,7} Child care providers complete self-assessments of their nutrition, active play, and screen time practices and receive training and technical assistance to implement self-selected changes to create healthier environments. Increasing the number of provider slots offered through a contract with child care training and technical assistance specialists at Keene State College, managed by New Hampshire's Department of Health and Human Services, Division of Public Health Services (DPHS), could broaden the current reach of the Go NAP SACC project, allowing more licensed child care programs to improve nutrition and physical activity policies and practices. Currently, Keene State works with 22 child care providers. Since 2010, over ninety licensed child care programs, caring for nearly 8,000 children, have participated in DPHS funded opportunities to improve 465 nutrition and physical activity policies and practices.

Comparing Costs and Outcomes

CHOICES cost-effectiveness analysis compared the costs and outcomes of expanding New Hampshire's NAP SACC program led by partners at Keene State College over 10 years.

Implementing NAP SACC in New Hampshire's largest child care programs is an investment in the future. By the end of 2025:

40,000 YOUNG CHILDREN REACHED

with more active play, less screen time, and healthier foods and drinks if current trainings were expanded.

OVER 600 CASES OF CHILDHOOD OBESITY PREVENTED

in 2025 with current program expansion.

\$72

COST PER CHILD

with current program expansion.

NEW HAMPSHIRE: Nutrition and Physical Activity Self-Assessment for Child Care (NAP SACC) Intervention

Conclusions and Implications

Every child deserves a healthy start in life. This includes ensuring that all kids in child care have opportunities to eat healthy foods and be physically active, no matter where they live or where they go for child care. A state-level initiative to bring NAP SACC to New Hampshire's largest child care programs by expanding its current opportunities could prevent over 600 cases of childhood obesity in 2025 and ensure healthy child care environments for 40,000 young children.

A separate model examined the potential for expanding access to Go NAP SACC via the state's Quality Rating Improvement System, which is a single-tiered system referred to as Licensed Plus. While such an initiative could be a useful policy tool for creating sustainable access to Go NAP SACC for NH child care providers, the results of that model indicated that fewer children (12,000) would be reached and fewer cases of obesity prevented in 2025 (100) at a slightly higher cost per child (\$81). The results of the two models suggest that New Hampshire's current contracted strategy targeting the state's largest providers may be more cost-effective. Results from both models reinforce the importance of investing in prevention efforts to reduce the prevalence of obesity. Shortchanging prevention efforts can lead to more costly and complicated treatment options in the future, whereas introducing small changes to young children can help them develop healthy habits for life.

The first few years of childhood may be the best time to promote healthy eating behaviors in children. Programs such as Go NAP SACC lay the foundation by helping child care providers create environments to nurture healthy eating habits and increase opportunities for physical activity for all of the children.
